Rules and Guide

1. Write your pseudocode for each of the task and add it at the top of the file before you begin the code. Use comment to make it unexecutable

2. Do the task in both Python Compulsorily

3. No outsourcing of the code is allowed. Write only own algorithm

4. Push to our assignment repository when you're done

1. Write a program that collects two age input (ranging from 1 to 80):

current father's age (years)

current age of his son (years)

Calculate how many years ago the father was twice as old as his son (or in how many years he will be twice as old). The answer is always greater or equal to 0, no matter if it was in the past or it is in the future.

semicolon

2. Write a program that calculates the average of the three scores passed to it and returns the letter value associated with that grade.

Numerical Score	Letter Grade
90 <= score <= 100	'A'
80 <= score < 90	'B'
70 <= score < 80	'C'
60 <= score < 70	'D'
0 <= score < 60	'F'

Tested values are all between 0 and 100. Theres is no need to check for negative values or values greater than 100.

3. Build a Simple Aritthemetic Calculator by ask for two numbers and an operator (+, –, *, /). Print result of the operation.

4. Build a Password Strength Checker collects users Input(password) and Check the strength:

Greater that 6 character but
less than or equal to 10 ⇒ Medium

Less than 6 ⇒ Weak

Greater than 10 ⇒ Strong

Lessa than 1   ⇒ is invalid

5 . Write a programm (Code) that Checks if a year is a Leap Year. A year is leap if:

- Divisible by 4
- BUT not by 100
- UNLESS also by 400

THANKS!

Hope that was fun?
