

YET ANOTHER SNACK

Note, implement all of these with an Array

1. Write a function that returns the largest element in an array.
2. Write function that reverses an array.
3. Write a function that checks whether an element occurs in an array.
4. Write a function that prints the elements on odd positions in an array.
5. Write a function that returns the elements on even positions in an array.
6. Write a function that computes the running total of an array.
7. Write a function that tests whether a string is a palindrome.
8. Write a function that compute the sum of the numbers in an array: using a for-loop, a while-loop and do while.
9. Write a function that concatenates two arrays. $[a,b,c], [1,2,3] \rightarrow [a,b,c,1,2,3]$
10. Write a function that combines two arrays by alternatingly taking elements, e.g. $[a,b,c], [1,2,3] \rightarrow [a,1,b,2,c,3]$.
11. Write a function that takes a number and returns an array of its digits. So for 2342 it should return $[2,3,4,2]$.
