

PHASE GATE:

NUMBER GUESSING APP

semicolon

CREATE A PROGRAM THAT

1. Generates a random number:

- Pick a random number between 1 and 100 (inclusive)
- Every session should produce a different number

2. Manages the guessing loop:

- Allow the user up to 5 attempts to guess the number
- After each wrong guess, tell the user if the answer is higher or lower
- If the user guesses correctly, stop immediately

3. Validates user input:

- If the user enters a non-number, show an error – do not count it as an attempt
- If the number is outside 1-100, warn them – do not count as an attempt

4. Tracks and displays a rating:

- 1 guess = Legendary | 2 = Excellent | 3-4 = Good | 5 = Close! | No win = Better luck

5. Displays a final summary:

- Show the correct number, attempts used, and rating

semicolon

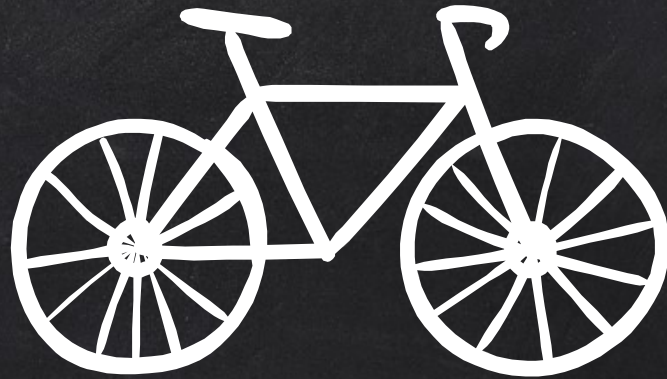

INSTRUCTION

This program should be written in Javascript,
Python, Java and Java. Do not move to the next
language until you're done with one

semicolon

THANKS!

Any questions?
